# APPENDIX A

## Haplogroup classification of the mitochondrial sequences of the Tswana population

---

This appendix consists of a list of the haplogroups and sub-haplogroups of the Tswana individuals in this study. The mitochondrial sequences were generated from a Tswana-speaking cohort of 50 individuals residing in the North-West Province of South Africa that was investigated for the purpose of this study. The mitochondrial haplogroup assignments were performed by using two (2) different haplogroup classification schemes, the Wallace classification system (2004) and the PhyloTree classification system (Van Oven and Kayser, 2009), as discussed in Section 5.12. The haplogroup and sub-haplogroups assignments of both the classification schemes are presented in Table A.1. The discrepancy between the assignments of the two classification schemes were addressed in Section 6.7.1.1.

Sequence name/isolate = the sample name given to the mitochondrial sequence under investigation; Ethnicity/geographic origin = the place of origin or the ethnicity of the individual to which the mtDNA sequence belongeds the sample design of the Tswana cohort of this investigation was discussed in Section 5.2; the prefix "TS" of the mtDNA sequence isolates indicates the Tswana heritage of the samples; haplogroup classification was performed by using two haplogroup classification schemes, a = Wallace classification system (2004) as discussed in Section 5.12, c = PhyloTree classification system (Van Oven and Kayser, 2009) as discussed in Section 5.12.

## APPENDIX B

### Global African mitochondrial genome dataset used in this study

---

This appendix contains information about the Global African mitochondrial genome dataset used in the analyses in this study (See Section 5.11.1). It consists of mitochondrial genome sequences generated from a Tswana cohort of 50 individuals residing in the North Western Province of South Africa and was investigated for the purposes of this study. Also included are 442 mitochondrial genome sequences that were retrieved from GenBank® and that were published in phylogenetic studies between 2004 and 2010 relating to African populations, as well as mitochondrial genomes that were generated in previous PhD studies at the CGR (Koekemoer, 2010; Isabirye, 2010) and that consisted of 42 mtDNA sequences from Khoi-San individuals and 39 mtDNA sequences from individuals of Ugandan origin. The Global African dataset contained 573 mitochondrial genomes in total. All of the mitochondrial genomes were selected to belong to the macrohaplogroup L, which is the macrohaplogroup that is specific for the African continent. Also included are the rCRS (Andrews *et al.*, 1999) and a mitochondrial sequence representing the chimpanzee (*Pan troglodytes*), which were used as an outgroup for all the analyses.

Haplogroup and sub-haplogroup assignments of the mitochondrial genomes are also indicated in Table B.1. The haplogroup assignments of the GenBank® mitochondrial genomes as published by Pereira *et al.* (2009) were used in conjunction with the haplogroup assignments determined by using two haplogroup classification schemes. These classification schemes consisted of the Wallace classification system (2004) and the PhyloTree classification system (Van Oven and Kayser, 2009), as described in Section 5.12. Reasons for inconsistencies in haplogroup assignments for the two classification systems are discussed in depth in Section 6.7.1. The mitochondrial sequence haplogroups generated in this investigation and the mitochondrial sequence haplogroups generated by other PhD studies at the CGR (Koekemoer, 2010; Isabirye, 2010) have not been published yet, as in the case of the mitochondrial sequences retrieved from GenBank® (Pereira *et al.*, 2009).

GenBank® accession number = a unique identifier for DNA sequences submitted to the GenBank® database to which information about the DNA sequence is connected; GI number = GenInfo Identifier number that is used to specify a specific DNA sequence; Sequence name/ isolate = the sample name given to the mitochondrial sequence under investigation; Ethnicity/ geographic origin = the place of origin or the ethnicity of the individual to which the mtDNA sequence belongs the ethnicity of the individuals contained in this dataset is discussed in detail in Section 5.11.5 in which the ethnic groups listed in this dataset were connected to the country of origin and region within which the country resides; African American refers to individuals of African origin that reside in the US; Dominican Republic refers to individuals that are of northern and western African origin that reside in the Dominican Republic; the mtDNA sequence isolates with the prefix "KS" belongs to the Khoi-San speaking populations of southern Africa, the term "Khoi-San" here includes all the different names for the Khoi-San speakers of southern Africa such as !Kung as discussed in Section 5.11.5; the mtDNA isolates with a prefix "UG" belong to individuals of Ugandan origin; haplogroup classification was performed by using published haplogroup assignments and two haplogroup classification schemes, a = published in Pereira *et al.* (2009), b = Wallace classification system (2004) as discussed in Section 5.12, c = PhyloTree classification system (Van Oven and Kayser, 2009) as discussed in Section 5.12; \$ = to indicate that the mitochondrial sequence could not be fully resolved by the haplogroup classification scheme used; D38112 = mitochondrial sequence that was retrieved from GenBank® where it is listed as a reference human mtDNA sequence that belongs to an individual from the African country of Uganda; NC\_001807 = a NCBI mitochondrial reference sequence that belongs to a western African individual of Yoruban ethnicity; NC\_001643 = a NCBI mitochondrial reference sequence representing the mitochondrial genome of a chimpanzee, *Pan troglodytes*; nr. = number; bp. = base pair; CAR = Central African Republic.

## APPENDIX C

### List of mitochondrial DNA sequences excluded from the Global African dataset to compile an All African dataset

---

This appendix contains information about the All African mitochondrial genome dataset used in the analyses described in this study (see Section 5.11.2). It consists of mitochondrial genome sequences of indigenous African individuals originating from and residing on the continent of Africa and therefore it is representative of the mitochondrial macrohaplogroup L. The All African dataset was constructed by eliminating the mitochondrial sequences belonging to individuals who did not reside on the African continent from the Global African dataset, as described in Section 5.11.1 and presented in Appendix B. The All African dataset consists of mitochondrial genome sequences generated from a Tswana cohort of 50 individuals residing in the North West Province of South Africa, that was investigated for the purposes of this study (see Appendix A), as well as mitochondrial genomes that were generated in previous PhD studies at the CGR (Koekemoer, 2010; Isabirye, 2010). This consisted of 42 mtDNA sequences from Khoi-San individuals and 39 mtDNA sequences from individuals of Ugandan origin. The same mitochondrial sequences that were retrieved from GenBank® for the construction of the Global African dataset were used with the exception of the mitochondrial sequences that belonged to African individuals who did not reside on the African continent. These mitochondrial sequences consisted of one individual from Jordan (Maca-Meyer *et al.*, 2001), 43 individuals from the Dominican Republic (Kivisild *et al.*, 2006; Torroni *et al.*, 2006), three Hispanics (Just *et al.*, 2008) and 140 individuals of African-American origin (Herrnstadt *et al.*, 2002; Just *et al.*, 2008). These are presented in Table C.1.

GenBank® accession number = a unique identifier for DNA sequences submitted to the GenBank® database to which information about the DNA sequence is connected; GI number = GenInfo Identifier number that is used to specify a specific DNA sequence; Sequence name/ isolate = the sample name given to the mitochondrial sequence under investigation; Ethnicity/ geographic origin = the place of origin or the ethnicity of the individual to whom the mtDNA sequence belongs the ethnicity of the individuals contained in this dataset is discussed in detail in Section 5.11.5 in which the ethnic groups listed in this dataset are connected to the country of origin and region within which the country resides; African American refers to individuals of African origin who reside in the US; Dominican Republic refers to individuals who are of northern and western African origin who reside in the Dominican Republic; haplogroup classification was performed by using published haplogroup assignments and two haplogroup classification schemes, a = published in Pereira *et al.*, 2009, b = Wallace classification system (2004) as discussed in Section 5.12, c = PhyloTree classification system (Van Oven and Kayser, 2009) as discussed in Section 5.12; \$ = to indicate that the mitochondrial sequence could not be fully resolved by the haplogroup classification scheme that was used; No. of bp. = refers to the length of the mitochondrial sequence.

## APPENDIX D

### Regional mitochondrial DNA genome datasets used in this study

---

This appendix contains information about the regional mtDNA genome datasets used for the statistical analyses of the sequence variation contained in the mitochondrial genomes of the All African dataset, as discussed in Section 5.11.2. The ethnicity of the mtDNA sequences obtained from GenBank® and used in the datasets of this investigation were published in a study by Pereira *et al.* (2009), according to country of origin or ethnic group. These ethnicities and countries were representative of broad African regions according to the CIA World Information; Chen *et al.* (1995a), Torroni *et al.* (2001) and Salas *et al.* (2002), as described in Section 5.11.5. Three subsets were constructed for the purpose of statistical analysis of the genetic diversity of the western, eastern and southern African regions and were referred to as the Western African dataset (4), Eastern African dataset (5) and Southern African dataset (6) respectively. The Western African dataset (4) consisted of 60 mtDNA sequences, the Eastern African dataset consisted of 110 mtDNA sequences and the Southern African dataset consisted of 66 mtDNA sequences. The All African dataset of this investigation did not contain a sufficient number of mitochondrial sequences from individuals of northern African origin and therefore this group was not included in this investigation. The full list of mitochondrial sequences for each of the regional datasets 4, 5 and 6 is presented in Table D.1.

Haplogroup and sub-haplogroup assignments of the mitochondrial genomes are also indicated in Table D.1. The haplogroup assignments of the GenBank® mitochondrial genomes, as published by Pereira *et al.* (2009), were used in conjunction with the haplogroup assignments of all the mitochondrial genomes by using two haplogroup classification schemes. These classification schemes consisted of the Wallace classification system (Wallace, 2004) and the PhyloTree classification system (Van Oven and Kayser, 2009), as described in Section 5.12. The mitochondrial sequence haplogroups generated in this investigation and the mitochondrial sequence haplogroups generated by other PhD studies at the CGR (Koekemoer, 2010; Isabirye, 2010) have not been published yet as in the case of the mitochondrial sequences retrieved from GenBank® (Pereira *et al.*, 2009).

GenBank® accession number = a unique identifier for DNA sequences submitted to the GenBank® database to which information about the DNA sequence is connected; GI number = GenInfo Identifier number that is used to specify a specific DNA sequence; Sequence name/ isolate = the sample name provided with the mitochondrial sequence under investigation; Ethnicity/ geographic origin = the place of origin or the ethnicity of the individual to whom the mtDNA sequence belongs, the ethnicity of the individuals contained in this dataset is discussed in detail in Section 5.11.5, in which the ethnic groups listed in this dataset are connected to the country of origin and region within which the country resides; the mtDNA sequence isolates with the prefix "KS" belongs to the Khoi-San-speaking populations of southern Africa, the term "Khoi-San" here includes all the different names for the Khoi-San speakers of southern Africa, such as !Kung, as discussed in Section 5.11.5; the mtDNA isolates with a prefix "UG" belong to individuals of Ugandan origin; haplogroup classification was performed by using published haplogroup assignments and two haplogroup classification schemes, a = published in Pereira *et al.*, 2009, b = Wallace classification system (2004) as discussed in Section 5.12, c = PhyloTree classification system (Van Oven and Kayser, 2009) as discussed in Section 5.12; \$ = to indicate that the mitochondrial sequence could not be fully resolved by the haplogroup classification scheme used; NC\_001807 = a NCBI mitochondrial reference sequence that belongs to a western African individual of Yoruban ethnicity; Zaire here refers to the current Democratic Republic of Congo (CIA, World Information); Bakola, Ewondo = ethnic groups that reside in Cameroon; Effik, Ibo, Hasau, Yoruba = ethnic groups that reside in Nigeria; Mossi, Rimaibe, Foulbe = ethnic groups that reside in Burkina Faso and Pygmy = ethnic groups that reside in Zaire/ Democratic Republic of the Congo; Nuba = ethnic group that resides in Sudan; Berta = ethnic group that resides in Ethiopia; Acholi, Lugbara, Baganda = ethnic groups that reside in Uganda; San, !Kung, Khoi-San = Khoi-San speaking populations that reside in southern Africa; Herero = Bantu-speaking ethnic group that resides in Angola, Namibia and Botswana; Zulu, Sotho, Pedi, Tswana = ethnic groups that reside in South Africa; no.= number; bp. = base pairs.

## APPENDIX E

### Global African and All African phylogenetic trees of this investigation

---

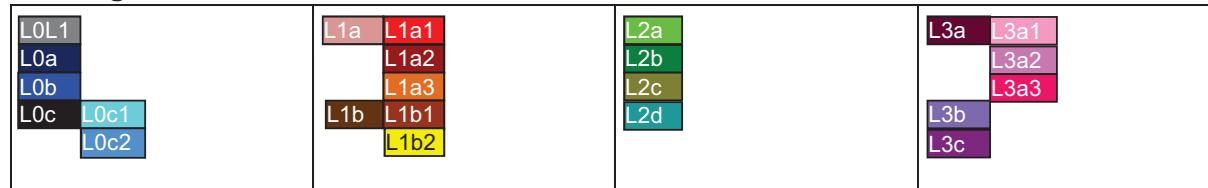

This appendix contains the phylogenetic trees that were constructed by using the Global African and All African datasets, as described in Section 5.11 and Section 6.8. The mitochondrial sequences contained in these datasets represent a broad collection of coding region mtDNA sequences belonging to individuals of African origin. Distinctions were made between the individuals residing in African countries only, as represented in the All African dataset, and those residing both in African and non-African countries, as represented in the Global African dataset. The purpose of the phylogenetic trees was to position the maternal lineages of the mtDNA sequences of the Tswana cohort under investigation in the context of the maternal lineages of a broad set of African individuals in an attempt to discover the evolutionary past of the Tswana-speaking individuals of this investigation.

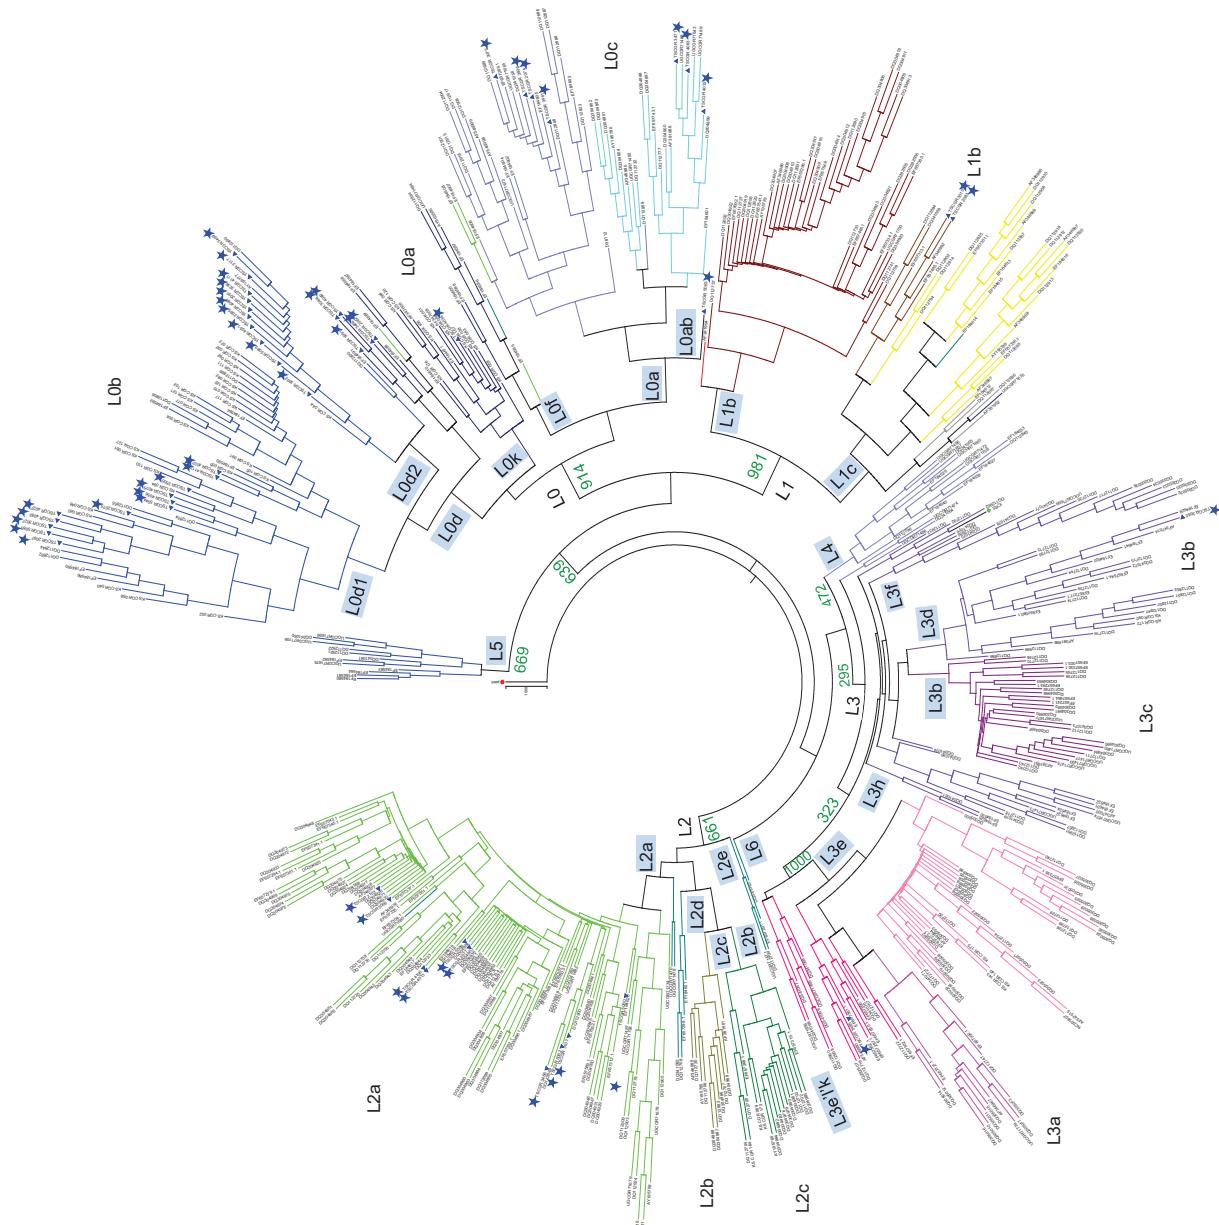

The phylogenetic trees were constructed by using the neighbour-joining (NJ) and maximum parsimony (MP) methods for tree-building, as described in Section 5.13. The NJ outtrees were generated by using PHYLIP 3.6 and were converted to a phylogram format in TreeView (Page, 1996). It was rooted by using an outgroup, the *Pan troglodytes* sequence. Thereafter it was viewed by using MEGA version 5 (Tamura *et al.*, 2007) in a circular format. The PHYLIP outtree format converted the bootstrap values into branch lengths. The MP trees were constructed by using MEGA version 5 (Tamura *et al.*, 2007) and viewed in MEGA Tree Explorer in a circular format rooted at the outgroup sequence *Pan troglodytes* with the bootstrap values indicated on the tree branches. The phylogenetic trees are presented in an A3 format and also in digital format on CD\_Appendix E (attached to the last page of the thesis) for ease of reference when using it as a guide for Section 6.8.

- C. All African NJ tree
- D. All African MP tree

The phylogenetic trees represent the coding regions of 573 mtDNA sequences of the Global African dataset and 386 mtDNA sequences of the All African dataset, as described in Section 5.11.1 and Section 5.11.2. The rCRS is indicated by a green diamond (◆) and the *Pan troglodytes* outgroup is represented by a red circle (●). The haplogroups and sub-haplogroups assigned by the Wallace classification system (2004) are presented in colours as described in the tree legend below. Major haplogroup branching is indicated at the branch splits on the tree and sub-haplogroup groupings are indicated on the outside of the tree. The PhyloTree (Van Oven and Kayser, 2009) haplogroup assignments are indicated in blue text boxes. MtDNA sequence identification is presented at the tips of the branches and the Tswana mtDNA sequences of this investigation are indicated by a blue triangle (▲) and blue star (★). The bootstrap values are indicated in green on the branches. The bootstrap values of the NJ trees are indicated as the number of repeats per 1,000 iterations and for the MP trees as a percentage value (See Section 6.8).

## APPENDIX F

### Phylogenetic trees of the Tswana-speaking individuals of this investigation

---

This appendix contains the phylogenetic trees that were constructed by using the Tswana dataset (3b) as described in Section 5.11.3, Section 6.85 and Section 6.8.6. The phylogenetic trees were constructed by using the neighbour-joining (NJ) and maximum parsimony (MP) methods for tree building, as described in Section 5.13. The NJ outrees were generated by using PHYLIP 3.6 and were converted to a phylogram format in TreeView (Page, 1996). It was rooted by using an outgroup, the *Pan troglodytes* sequence. Thereafter it was viewed by using MEGA version 5 (Tamura *et al.*, 2007) in a circular format. The PHYLIP outtree format converted the bootstrap values into branch lengths. The MP trees were constructed by using MEGA version 5 (Tamura *et al.*, 2007) and viewed in MEGA Tree Explorer in a circular format rooted at the outgroup sequence *Pan troglodytes* with the bootstrap values indicated on the tree branches. The phylogenetic trees are presented in an A3 format and also in digital format on CD\_Appendix F (attached to the last page of the thesis) for ease of reference when using it as a guide for Section 6.8.

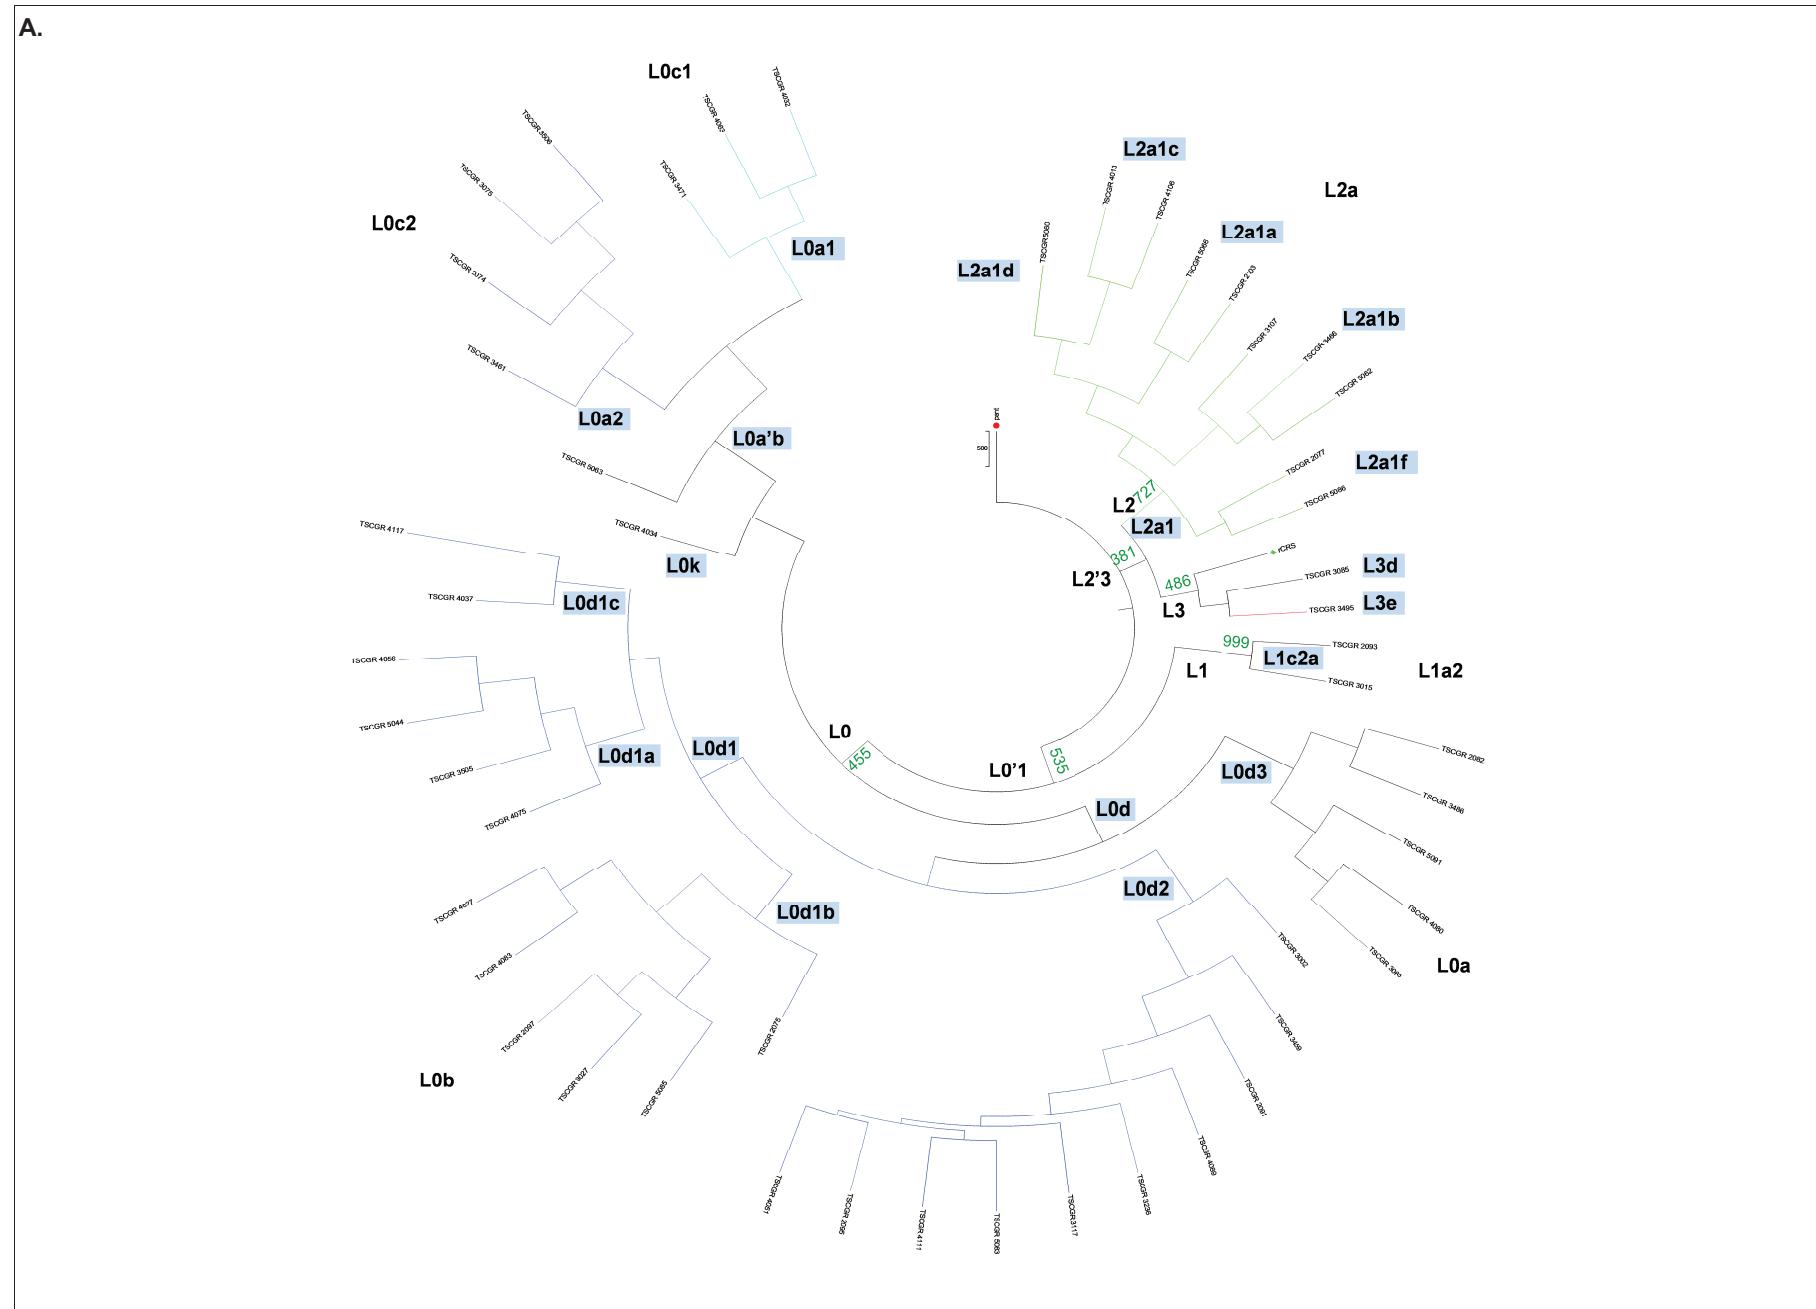

## Figure F.1 Phylogenetic trees of Tswana-speaking individuals of this investigation

- A. Tswana NJ tree
- B. Tswana MP tree

The phylogenetic trees represent the coding regions of 50 mtDNA sequences of the Tswana dataset as described in Section 5.11.3. The rCRS is indicated by a green diamond (◆) and the *Pan troglodytes* outgroup is represented by a red circle (●). The haplogroups and sub-haplogroups assigned by the Wallace classification system (2004) are presented in colours as described in the tree legend below. Major haplogroup branching is indicated at the branch splits on the tree and sub-haplogroup groupings are indicated on the outside of the tree. The PhyloTree (Van Oven and Kayser, 2009) haplogroup assignments are indicated in blue text boxes. MtDNA sequence identification is presented at the tips of the branches. The bootstrap values are indicated in green on the branches. The bootstrap values of the NJ trees are indicated as the number of repeats per 1,000 iterations and for the MP trees as a percentage value (See Section 6.8).

# APPENDIX G

## Mitochondrial consensus sequence for a Tswana-speaking population of South Africa

---

The Tswana mtDNA consensus sequence is presented in this appendix. It was constructed from the full mitochondrial genomes of the 50 Tswana-speaking individuals of this investigation by using BioEdit version 7.0.5.2 (Hall, 2001). The sequence variants that were present in the majority of the Tswana-speaking individuals of this investigation were included in the consensus sequence. In cases where two sequence variants were distributed in equal quantities across the Tswana samples of this investigation, the sequence variants were indicated as ambivalent (R, Y, S or M) by the BioEdit version 7.0.5.2 (Hall, 2001) software. This ensured that both sequence variants were acknowledged as contributing to the total sequence variance of the Tswana consensus sequence. The rCRS (Andrews *et al.*, 1999) was used to determine the positions of the sequence variants.

Nucleotide numbering is based on the rCRS (Andrews *et al.*, 1999). The sequence variants that differed from the rCRS were indicated in **bold**. The ambivalent sequence variants were indicated in **red** by the IUPAC codes; R = A or G; Y = C or T; S = G or C; M = A or C.

## APPENDIX H

### Tswana mtDNA consensus sequence variants that differed from the rCRS

---

This appendix contains a list of the 69 sequence variants of the Tswana consensus sequence that differed from the rCRS (Andrews *et al.*, 1999). These are the sequence variants that were present in the majority of the Tswana-speaking individuals of this investigation that differed from the rCRS sequence composition and therefore represent the baseline sequence variation of this Bantu-speaking population from South Africa.

**Figure H.1 Mitochondrial consensus sequence for a Tswana-speaking population of South Africa**

Position	Sequence variants	Gene/region	Frequency

16311	T-C	Control region	39
16519	T-C	Control region	39

Numbering according to rCRS. Gene/region: 12S = 12S ribosomal RNA; 16S = 16S ribosomal RNA; I = tRNA isoleucine; D = tRNA aspartic acid; T = tRNA threonine; ND1 = NADH Dehydrogenase subunit 1; ND2 = NADH Dehydrogenase subunit 2; COI = Cytochrome c oxidase subunit 1; COII = Cytochrome c oxidase subunit 2; ATP8 = ATP synthase F0 subunit 8; ATP6 = ATP synthase F0 subunit 6; COIII = Cytochrome c oxidase subunit 3; ND3 = NADH Dehydrogenase subunit 3; ND4L = NADH Dehydrogenase subunit 4L; ND4 = NADH Dehydrogenase subunit 4; ND5 = NADH Dehydrogenase subunit 5; CYTB = Cytochrome b; frequency indicates the number of Tswana-speaking individuals of this investigation that displayed the sequence variant.
